

Interactive

AUTOMATIC FILE TRANSFERS

Automatically transfer audio, logs, audit files or other data files to one or more remote locations.

PROGRAM DOWNLOADS

Automatically download programs from the content providers FTP site as updates are made or new files are posted.

FTP EXPLORER

Manually monitor files on your FTP sites. Upload or download files for as required. Save your login for easy access.

MAESTRO USERS

Our specialized DAF and multi-cut processes were designed specifically to assist the Maestro Import ensuring single and multi-cut carts are added to the cart inventory.

FTP SITE MAINTENANCE

Using our unique one to many addressing feature a single upload can be downloaded to any number of remote CS Interactive sites and when the last site downloads the files they are deleted from the FTP site.

- Monitors one or more location directories for new or changed files based on specific criteria and copies them to another location for processing.
- Automatically uploads or downloads files to one or more FTP Sites
- Move and if necessary, rename files from one location to another
- CS Copy Management users can send script copy written in one location for production in another and the completed audio file will be returned.
- Special modules monitor programming sites and provide access to FTP sites to view, upload or download files

As we become more centralized, the files created at one location need to get to one or more locations as soon as possible. With heavier workloads and fewer people, the ability to automate this process is critical. As more and more people have access to the FTP login information there can be security with staff turnover. That's where CS Interactive comes in. When files are updated or added, CS Interactive will automatically transfer these files to where they are needed, 24 hours a day 7 days a week without any human intervention. Staff simply create the files as they would for the local station without ever needing to transfer files or even know they are going. Audio files, Logs, Audit Files or any other data files that need to move is automatically sent where it's needed.

The most common CS Interactive configuration is sending audio files and logs via FTP from the centralized host to one or more remote stations which return the audit files. However, CS Interactive is not limited to broadcasting and can send a wide variety of files.

Simply tell CS Interactive what to watch and where it is to go and CS Interactive takes care of the rest.

Features and Benefits

Files are automatically transferred from and to various locations without any human intervention. Those creating or updating the information never need access to the FTP site, login information or even connect to the internet.

The one-to-many uploads and the automatic file deletions minimize the disk usage on the FTP site.

Automating the download from various program FTP sites not only reduces the manual work load, but minimizes the number of staff that need to know confidential login information.

Our FTP Explorer allows for quick and easy access to FTP sites as required.
